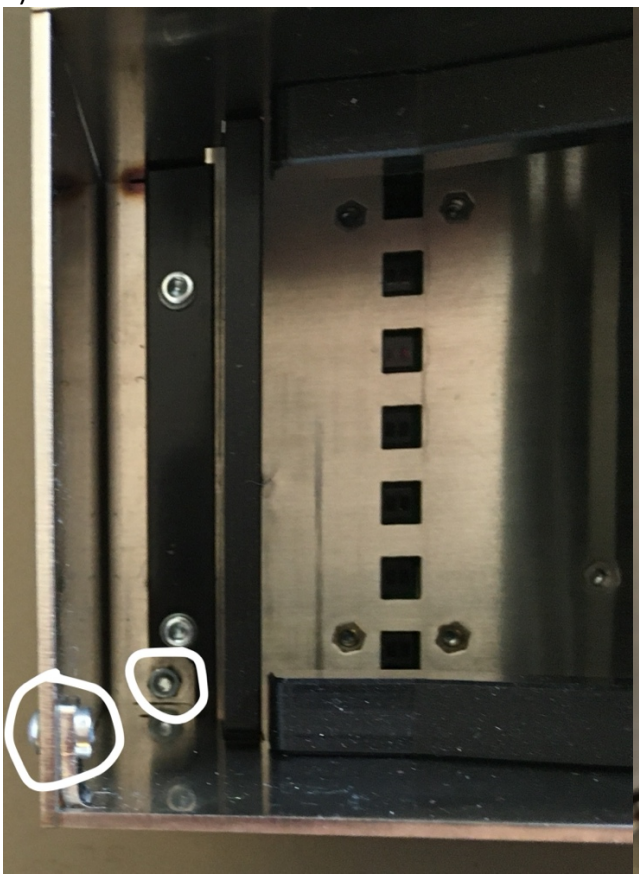
REPLACING BANDS IN BRIDGESORTER AND DUPLIMATE MK 5-6

We recommend that you study how the dividers and the springs sit in the card path before you start screwing as you will need to be put these parts back in position. (They will most probably fall out of position.) .We suggest that you take a series of photos if you do not have good visual memory.

1. Remove the cover.

2. Remove the 3 screws in the card path holding the front panel.

a) North end



b) Hopper end

3. Remove the 7 outer screws holding the front panel

4. Replace both bands at the same time (if one of band is OK, you can keep that as a spare to use in emergency).

5. Mount the front panel. Note the the small ball bearings are sensitive to axial pressure. So be careful to not use brutal force when you put the bearings back into their positions in the front panel.
